6.S974/2.S988/1.S980 – Games, Learning, and Security
Fall 2026

Wargame Deliverable 2 – Workshop 1, Due: October 26, 2026

Saurabh Amin, Mathieu Dahan, Asuman Özdağlar, Themistoklis Sapsis

Written Report

Submit one PDF document per team, up to 5 pages excluding references, with your project title and team members. Your report should be self-contained and address the following:

a) **Setting and research questions.** Describe the contested system, the decisions that matter, and why strategic interaction is central to the problem. State 2–3 focused research questions and identify the outcomes you will measure. Explain any substantive changes from your proposal and how you incorporated feedback.

b) **Literature and current practice.** Summarize the academic work most relevant to your model and methods, and explain how decisions are currently made in the application. Provide complete references, distinguish documented practice from modeling assumptions, and clarify what your project draws from existing work and what it adds.

c) **Game formulation.** Define the agents, objectives, actions, resource constraints, information available at each decision, and sequence of play. Specify the system state, uncertainty, transition dynamics, time horizon or termination rule, and payoff functions. Explain the main simplifying assumptions and justify the game structure you use. Mathematical notation, a timeline, and/or a small example should make the interaction unambiguous.

d) **Preliminary results.** Present preliminary analytical and/or numerical results that address your research questions. Explain your approach and discuss the main insights and limitations.

e) **Prototype.** Describe the current state of your computational wargame and illustrate how it operates. Explain how the implementation reflects your model and identify the main components that remain to be developed.

f) **Plan for Workshop 2.** Identify the main remaining modeling and implementation tasks. Explain how you will develop and evaluate learning or adaptation, attacks and defenses, and alternative resilient designs.

Prototype Code

Provide a runnable implementation of a small instance of your wargame. Submit the (commented) code developed so far and include basic instructions for running any functional components.

Oral Presentation

Each team will give a 10-minute presentation (+2 minutes for questions). Submit one slide deck, which should organize your presentation around the following:

a) **Motivation and question:** What system are you studying, and what do you hope to learn?

b) **Mathematical model:** Who makes which decisions, when, and with what information and incentives?

c) **Prototype and evidence:** Show how the testbed works through a small example, a simulation trace, or a brief demonstration, and explain your main preliminary comparison. What does your initial analysis show?

d) **Next steps:** Identify your plan and priorities for Workshop 2.

Use readable figures and explain the meaning of your results. Be prepared to justify your modeling choices and discuss what your current evidence does and does not establish.
